

SONNABON

The operations and planning manager a small bakery cannot afford.

[AWS Agents for Humans](#) · [Professional Agents](#) · [Strands Agents SDK](#)

Sarah closed an hour ago. She opened at four.

21:14

The two decisions that decide
whether this shop makes money
have still not been made.

How much to bake tomorrow

Nine products. From memory.

What to order, and by when

Four suppliers. Four deadlines.

Christmas

Due in October's post. It will not happen.

Nobody trained her for any of it.

One thing already exists, and arrives every day

SARAH 'S		
no. 1204	08:14	
2	Croissant	2.60
1	Coffee	2.20
1	Cinnamon roll	3.20
TOTAL		8.00

about 450 of these a day

Sonnabon is given nothing else.

No stock system. No spreadsheet. No forms.

It carries the time, not just the date.

“We sold forty” and “we ran out at ten past ten”
are not the same sentence.

Sold out looks like a good day

60 sold. The shelf was empty.

132 actually wanted one.

72 left with nothing.

€233 of margin walked out.

7h 09m with nothing on the tray.

A till counts what leaves the shelf. It cannot count who left without buying.

So she hires one

It reads the timestamps, works out what really ran out, and plans from that.

OPERATIONS

Reads the till at every close

Works out what ran out

Decides tomorrow's bake, product by product

PLANNING

Holds the calendar and every run-up

Says what to order, and when

Gives each person their list

It emails her only when a decision needs a person.

It never orders, never agrees a price, never touches a supplier.

One file in, one decision out

WHAT IT IS GIVEN

One line per sale · about 450 a day

THE CORRECTION

60 sold becomes 132 wanted · 91% precision

THE AGENT

One Strands Agent · 16 tools · one HookProvider

WHAT IT DECIDES

Tomorrow's bake · what to order · who does what

WHERE IT LANDS

The board · one email · the diary

the counter confirms
what ran out

Nothing downstream ever reads raw sales.

How it holds together

A day, and nobody touches it

One button. Three minutes. Nobody types.

Does it actually do better

120 DAYS REPLAYED, BOTH PLANS PRICED AGAINST DEMAND WE KNOW

	Waste	Lost sales	Total
As she plans today	€9,912	€8,321	€18,233
With Sonnabon	€12,579	€3,690	€16,269

Lost sales down 56%.

Waste goes up. That is correct: it buys availability with flour.

AND EVERY LIFT IT QUOTES CAME FROM HER OWN TILLS

	Raw till	Corrected demand
Halloween	1.31x	1.91x
Christmas	1.49x	3.49x

AND IT LEAVES HER ALONE

30 nights it woke

8 nights it reached her

22 nights it handled alone

A night earns an email by being unusual for this shop.

What Sarah gets back

THE TIME

7 h

a week, handed back

About 375 hours a year. An estimate of what these jobs take by hand.

THE MONEY

€5,000

a year, recovered

Measured over 120 replayed days. Lost sales fall from €8,321 to €3,690.

THE COST

\$25

a year, to run it

Two wakings a day, about 6,500 tokens each. Measured from the real tool output.

Lost sales down 56%. Waste goes up a little, and that is correct: it buys availability with flour.

Better than the current method on 65 days out of 120. The calculation that never got done now happens every night.

Five thousand euros back, for twenty-five dollars of arithmetic.

It runs every night.
It reaches her twice a month.

That ratio is the product.

She did not get a dashboard. She got the hour back.
