

SONNABON

The operations and planning manager a small bakery cannot afford.

Slide content for the five minute submission. AWS Agents for Humans, Professional Agents track.

Thirteen slides	About 22 seconds each. Five minutes is shorter than it sounds.
Shape	Story (1-4) · The answer (5-6) · How it works (7-8) · Proof (9-12) · Close (13)
Every number	Measured from the repo on 2026-09-09, not estimated
Never cut	Slide 4, slide 7, slide 9, slide 11
Cut first if long	Fold slide 1 into slide 2. The story is already the longest act
Held back	The appendix at the end is for questions, not for the film

STORY

SLIDE 1 COLD OPEN · 20 SECONDS

21:14

ON SCREEN

- One photograph: a pâtisserie counter at closing time
- What is left on it, and the empty trays beside it
- One line of type, bottom left: 21:14. She has been here since 04:00.

NOTHING ELSE

No logo, no product name, no interface. The first twenty seconds are a person, not software.

Say *Two decisions decide whether this shop makes money. How much to bake, and how much to order. Both get made last, and both get made from memory.*

SLIDE 2 THE CHARACTER · 25 SECONDS

Sarah runs a pâtisserie

ON SCREEN · LEFT

- 9 products
- 4 people
- About 450 customers on an ordinary day

ON SCREEN · RIGHT, UNDER A PHOTO OF ONE RECEIPT

This is what Sonnabon gets. Nothing else.

SMALL, UNDERNEATH

She tells it the menu and who works when, once, in the first message. After that the only thing arriving is the till.

Say *A shop has more than this. But this is the part that already exists, already arrives every day, and needs nobody to type it in.*

SLIDE 3 THE BURDEN · 30 SECONDS

Three jobs nobody hired anyone to do

ON SCREEN · THREE COLUMNS

	What it is	Why it does not happen
The time	Tomorrow's production, and remembering what is due when	It happens after close, tired, from memory
The maths	How much of each thing to make is a real calculation	There is no hour for it, and nobody was taught which numbers matter
The planning	Christmas needs flour ordered three weeks out	A shop deciding tonight's bake at twenty to nine is not thinking about October

Say *The third one never happens at all. There is no evening left for it.*

Sold out looks like a good day

ON SCREEN

The sell-out chart, full bleed. Two curves and the gap between them. Let it sit.

THE NUMBERS ON IT

Sold	60 tiramisu. Nothing left on the shelf.
Tray emptied	12:51
Shelf stayed empty	7 hours 09 minutes
Actually wanted one	About 132 people
Left with nothing	72 people, and €233 of margin

THE LINE UNDER IT

A till counts what leaves the shelf. It cannot count who left without buying.

AND THE CONSEQUENCE. SMALLER

So the shortfall never appears anywhere, and next year she bakes sixty again.

Say This is the part no forecast she could buy would fix, because every one of them is trained on this same file.

THE ANSWER

SLIDE 5 THE REVEAL · 20 SECONDS

This is Sonnabon

ON SCREEN

The chef mark, the name, and one sentence. Nothing else.

The operations and planning manager a small bakery cannot afford.

UNDERNEATH, SMALL

Briefed once, the way you would brief a manager on their first day. After that it runs the production side without being asked.

ONE LINE IN THE CORNER, SMALL

Every colour is one of fourteen tokens. A shop sets its own palette and the whole thing follows, charts included.

Say Sarah cannot hire an operations manager and a planner. So she is both, at nine at night. This is that hire.

SLIDE 6 WHAT IT DOES · 30 SECONDS

One job, two halves

ON SCREEN · TWO PANELS

OPERATIONS	PLANNING
Reads the till at every close of trade.	Holds the calendar and the run-up to every occasion.
Works out what ran out, not just what sold.	Works backwards to the day the ingredients must be ordered.
Decides tomorrow's production, product by product.	Hands each person their list, and reads back what was ticked.
Says what needs ordering, and on which day, before it is late.	Looks outward for markets and fairs worth a stall.

THE LINE THAT MATTERS MOST

It emails her only when a decision needs a person.

AND SAY THIS OUT LOUD, BEFORE ANYONE ASKS

WHAT IT WORKS FROM	WHAT IT NEVER DOES
The menu and who works when, told once in the first message	Order anything. It says what is due and when, and stops there
Every receipt, as it arrives	Agree a price or change a supplier
What the team ticked off	Commit to anything contractual
The time, and where the shop is in its day	Act twice. One irreversible action per run, enforced in the loop

Anything with money or a supplier on the other end stays a person's job. The agent is told so in its own prompt, and the gate is code, not wording.

HOW IT WORKS

Draw slide 7 as five stacked bands, full width, one arrow between each, and one long arrow returning from the bottom band to band two. That return arrow is the point of the whole diagram: it is a loop, not a pipeline.

SLIDE 7 THE SCHEMA · 45 SECONDS · DO NOT CUT

End to end, one screen

1 WHAT IT IS GIVEN

The till writes one line per sale, appended, never rewritten
number · time · items · quantity · unit price

About 450 of them a day

→ Plus the menu and who works when, once, in the first message

↓ raw sales

2 THE CORRECTION ← THE PART NOBODY ELSE HAS

Sell-out detection which products stopped selling dead, and at what minute

Demand estimation how far through its normal curve it got before it stopped

Corrected history what people wanted, not what the shelf allowed

60 sold becomes 132 wanted · 91% detection precision · 3.0% median error

→ Nothing downstream ever reads raw sales again

↓ corrected demand

3 THE AGENT · STRANDS

One Agent · 15 tools · one HookProvider

5 read the shop the day, the receipts, the clock, what the team ticked

5 do the maths the plan, the losses, the trends, and Python for the rest

3 look ahead the calendar, one occasion, the web

1 acts notify_owner, and nothing else can reach the outside

→ Its limits are hooks that cancel the run, not prompt text a model can argue with

↓ decisions

4 WHAT IT DECIDES

Tomorrow's bake per product, so cheap things get made past the point of certainty

When to order the day each order is due, worked back from the occasion

Occasion run-up lift measured from this shop's tills, not a typed constant

Team tickets split by who starts when

→ The owner's own column is deliberately empty

↓ out

5 WHERE IT LANDS

The board each person's list, ticked off on the shared server

One email only when a decision needs a person

The diary every waking written down, including the quiet ones

→ The counter confirms what ran out, and that answer returns to band 2

↑ the confirmation loops back into the correction ↑

Say A confirmed sell-out is a fact it can lean on. An unconfirmed one is still its own inference. It knows the difference when it speaks.

What it runs on

ON SCREEN · TWO COLUMNS

BUILT AND RUNNING	THE DEPLOYMENT SHAPE
Strands Agents SDK · one Agent, 15 @tool functions, one HookProvider	EventBridge Scheduler · one schedule per shop, per trigger
Amazon Bedrock · Claude, resolved from the environment with no code change	AgentCore Runtime · one session per bakery, isolated by process
S3 · the till export, read incrementally by byte offset	SES · the one email, when a decision needs a person

THE ONE TECHNICAL POINT WORTH MAKING OUT LOUD

The limits are hooks, not prompt text.

A ceiling in a system prompt is a request, and a model can talk itself out of a request. A hook inside the SDK's own loop cancels the run and is never consulted. It gates spend, looping, and irreversible actions.

AND THE CONSEQUENCE

Because the action count comes from the tool about to run, whether it emailed the owner is answered by the invocation, not by the model's closing paragraph.

PROOF

SLIDE 9 THE AGENT WORKING · 20 SECONDS · DO NOT CUT

Watch it think

ON SCREEN

Live capture of the panel. Press What stood out today and let the run stream. Do not narrate over the first eight seconds; let the tool calls go past on their own.

WHAT THE JUDGE NEEDS TO SEE HAPPEN, IN ORDER

On the panel	What it proves
waking up	The run started. This is a real model, not a script
1 right_now	It checks the clock before it judges anything
2 shop_status	It finds out what period it is looking at
3 day_report	It reads the day
4 team_board	It checks what the team actually ticked
thinking \$0.0021	The ledger counting spend as the run goes, not after
one sentence back	A decision, in its own words
4 tool calls · \$0.003 · 6s	What it cost. Less than one unsold cake a week

THEN DO THIS, AND IT IS THE BETTER VERSION OF THE SHOT

Type a question into the bar mid-afternoon, while the till is still running: how are we doing so far today?

- It calls right_now, sees the shop is open, and calls sales_so_far
- It answers about the day in progress, not last night
- It says the figures are raw, because a product gone quiet at 11am may have run out or may just be slow
- The diary gains a line that reads you asked, not close of trade

SAY EXACTLY THIS WHILE IT RUNS

Nothing here is scripted. If no model answers, it says so rather than inventing one.

Say This is the slide that proves the agent exists. Everything else in the film is what the agent produced.

SLIDE 10 NOT A TABLE, HER SHOP · 25 SECONDS

Every number comes from her own tills

ON SCREEN

	Her raw till says	Corrected demand says	Most software
Halloween	1.31x	1.91x	one number, everywhere
Christmas	1.49x	3.49x	one number,

everywhere

THE CONSEQUENCE

A shop planning Christmas from its own till under-bakes by more than half.

Say *It measured hers. Cinnamon roll, glazed donut, chocolate chip cookie: one point nine one times, last year, in this shop.*

SLIDE 11 THE AUTONOMY SHOT · 45 SECONDS · DO NOT CUT

Press one button, then stop talking

ON SCREEN

Live screen capture. Press Start the till, then say nothing for fifteen seconds and let it move.

WHAT HAPPENS WITHOUT ANYONE TOUCHING IT

Shop clock	What happens on screen
07:00 →	Bills arrive one at a time into the same file the agent reads. The figures climb.
09:30	The bakers finish their trays. The board ticks itself.
18:00	The counter confirms what ran out.
19:30	It wakes on its own, reads the day, plans tomorrow, and decides whether Sarah needs telling.

CAPTION ON SCREEN

Twelve hours in three minutes. Nobody is typing.

SLIDE 12 THE RESTRAINT · 30 SECONDS

It reached her 8 nights out of 30

ON SCREEN · THREE FIGURES, LARGE

30	8	22
nights it woke	nights it reached her	nights it handled alone

UNDERNEATH, TWO LINES ONLY

- An agent that emails every night is filtered within a week.
- A night earns an email by being unusual for this shop, not by clearing a number every shop clears most days.

Say *It wakes every close of trade. The diary shows every quiet night, and the quiet nights are the point.*

Does it actually do better

ON SCREEN · THE TABLE FIRST

120 days, replayed	Waste	Lost sales	Total
As the shop plans today	€9,912	€8,321	€18,233
With Sonnabon	€12,579	€3,690	€16,269

READ IT IN THIS ORDER

- Lost sales fall by 56 percent.
- Waste goes up, and that is correct. It buys availability with flour.
- About €5,000 a year, and better on 65 days out of 120.

THEN CLEAR THE SCREEN AND END ON THIS

It runs every night. It reaches her twice a month.

That ratio is the product.

Say She did not get a dashboard. She got the hour back, and the two decisions that were made from memory are now made from her own data.

APPENDIX · NOT IN THE FILM

Hold these back. They are answers to questions, and questions only come if the five minutes worked.

EVERY FIGURE, AND IT IS ALL MEASURED

Figure	Value
A typical day	448 customers, 827 units
The record	149,384 bills · 318 trading days · 9 products
Real sell-outs in the year	807
Detection	91% precision, 80% recall
Demand estimate	3.0% median error, within 20% on 99% of 649 scored days
A year of lost margin	estimated €27,618 against a true €29,566
The day on slide 4	16 Aug 2026, Tiramisu: 60 sold, ~132 wanted, out 12:51, empty 7h09
Halloween lift	till 1.31x · corrected 1.91x
Christmas lift	till 1.49x · corrected 3.49x
Counterfactual	120 days · lost sales €8,321 → €3,690 · net €1,964 · better on 65 of 120
Restraint	speaks 8 nights in 30
Build	15 tools · 70 tests · 24.9s cold build, 0.90s warm

THE QUESTION THAT WILL BE ASKED

"Your data is generated."

Yes, and that is the method rather than an apology. No real till can tell you how many people wanted something and left, so no real dataset can score a sell-out estimate. Ours can, because the demand was generated first and then served out of a limited tray. That is the only way these accuracy figures can exist at all.

THE SECOND QUESTION

"What does the model add over a script?"

Restraint. A script always speaks. The agent decides whether anything is worth the owner's attention at all, and the diary shows it staying quiet on 22 nights out of 30. That is judgement, and a rule cannot do it.

WHAT WAS DELIBERATELY LEFT OUT OF THE FILM

- The Reports tab and the printable week
- Best sellers three ways, and the trends view
- The setup conversation, beyond the four seconds of receipt on slide 2
- Everything in this appendix

ONE THING TO SOURCE BEFORE PRESENTING

If you open on bakery margins or waste percentages, find a citation. That figure is not measured in this project and a judge may check it. Opening on Sarah directly loses nothing.
